Issue: Offline Login Issue in CCTNS Client Application

Problem Statement:
When a user attempts to log in to the CCTNS client application in offline mode, the login fails because the user's ID has not been synchronized from the online server to the offline database.

Resolution Steps:

1. **Identify the Affected User:**
   - Confirm the user ID and verify that the user is unable to log in while in offline mode.
2. **Check Synchronization Status:**
   - Ensure that the user's data has not been synced from the online server to the offline client.
   - This can be verified by checking the offline database or logs on the client machine.
3. **Login through `adminpuducherry` Account (Online Mode):**
   - Launch the CCTNS client application.
   - Use the `adminpuducherry` credentials to log in **in online mode**.
   - This admin login will trigger the synchronization process for users, including the one facing the issue.
4. **Allow Synchronization to Complete:**
   - Wait for the synchronization process to finish.
   - Ensure there are no network interruptions during this time.
5. **Verify the User in Offline Mode:**
   - Log out from the admin account.
   - Switch to **offline mode**.
   - Ask the user to log in again using their credentials.
   - The login should now be successful as their data has been synced.
6. **Optional - Restart the Application:**
   - In some cases, restarting the client application may be required after synchronization to reflect updated user records.
